## §2.1: Rates of Change and Tangents

1.] Consider the following function below that describes the vertical distance travelled by a grenade launched vertically from the ground with a speed of $96 \mathrm{ft} / \mathrm{sec}$ :

$$
f(x)=-16 x^{2}+96 x
$$

Here $x$ is in seconds and $f(x)$ is in feet. Find the average velocity of the grenade between 1 and 3 seconds of it being in the air.
2.] Estimate the slope of the tangent line shown in the given graphs below:

3.] Consider the position function $y=16 x^{2}$, where $y$ is the distance a piece of rock has fallen from a deep canyon, if we ignore air resistance. Here, $y$ is measured in feet and $x$ is measured in seconds. Estimate the instantaneous velocity of the rock after two seconds.

| Time interval | $[2,2.5]$ | $[2,2.1]$ | $[2,2.01]$ | $[2,2.001]$ |
| :---: | :--- | :--- | :--- | :--- |
| Change in time <br> $(\Delta x)$ |  |  |  |  |
| Change in distance <br> $(\Delta y)$ |  |  |  |  |
| Average velocity <br> $\left(\frac{\Delta y}{\Delta x}\right)$ |  |  |  |  |

| Time interval | $[1.5,2]$ | $[1.9,2]$ | $[1.99,2]$ | $[1.999,2]$ |
| :---: | :--- | :--- | :--- | :--- |
| Change in time <br> $(\Delta x)$ |  |  |  |  |
| Change in distance <br> $(\Delta y)$ |  |  |  |  |
| Average velocity <br> $\left(\frac{\Delta y}{\Delta x}\right)$ |  |  |  |  |

Make a conjecture about the value of the instantaneous velocity at $x=2$.
